

Pesticides and Chemical Weapon Standards

Essential to agricultural productivity and general pest control, many pesticides have been found to be toxic to humans and animals, and as such have been banned from use in numerous countries. The Stockholm Convention has focused worldwide attention on analysis of the most toxic pesticides. CIL promotes the development of new isotope-labeled legacy and “new use” pesticides to support laboratories using IDMS for the most accurate analytical results.

Pesticide Standards

CIL continues to add to its already extensive inventory of isotopically labeled standards for pesticide and pesticide metabolite analysis. As a result of this development over the past few years, CIL can now present its standards by category, including organochlorine, organophosphorous, carbamate, triazine, or pyrethroid pesticide standards. You can still find the complete listing if you wish to scan through the comprehensive array of standards.

Chlorinated Cyclodiene Pesticide Standards

Chlorinated cyclodiene pesticides account for seven of the compounds governed by the Stockholm Convention. While production and use of these compounds is stringently regulated if not banned outright, their widespread use for decades and persistence in the environment ensures their presence in the environment and biota for years to come. CIL offers a comprehensive selection of the individual standards, as well as a growing list of convenient mixes.

Organochlorine Pesticide Standards

Organochlorinated pesticides, like chlorinated cyclodiene pesticides, are heavily represented in the list of compounds governed by the Stockholm Convention. Also, like chlorinated cyclodiene pesticides, their widespread use for decades and persistence in the environment ensures their presence in the environment and biota for years to come.

Organophosphate (OP) and Carbamate Insecticides

Organophosphates are a large class of contact insecticides that target the insect's nervous system by interfering with the enzyme acetylcholinesterase, disrupting nerve impulses and killing or disabling the insect. Organophosphate insecticides and chemical warfare nerve agents (such as sarin, tabun, soman, and VX) work in the same way, and metabolites of both groups are quite similar. Organophosphates have a cumulative toxic effect to wildlife, so multiple exposures to the chemicals amplifies the toxicity. Carbamates feature the carbamate ester functional group and kill insects by reversibly inactivating the enzyme acetylcholinesterase, similarly to organophosphate pesticides. They are, however, much less stable in the environment and break down rapidly.

Pyrethroid Insecticides

Pyrethroids are synthetic pesticides developed to mimic the effect of naturally occurring pyrethrins. In general, pyrethroids are low in toxicity to mammals and birds, however, they are potentially highly toxic to fish, have high arthropod toxicity, are fast acting, dissolve poorly in water, and break down quickly, especially in direct sunlight. Pyrethroids became popular as consumer insecticides in the 1990s as replacements for older pesticides, like diazinon and Dursban®, which were phased out for environmental and human-health reasons.

Neonicotinoid Pesticides

Neonicotinoids have received a lot of attention in the mainstream press as a possible cause of colony collapse disorder (CCD) in honeybees, which are critical pollinators in many agricultural environments where their viability enables billions of dollars of commerce each year. While CCD may also have other causes, analytical chemists have focused on neonicotinoid pesticides as a potential contributing factor. CIL has produced several neonicotinoid standards, including labeled standards with chloropyridylmethyl, chlorothiazolylmethyl, and tetrahydrofuranylmethyl substituents, as well as major metabolites of those compounds.

Toxaphene Standards

CIL has put considerable effort into developing the first set of ¹³C-labeled toxaphene standards. The list of labeled and unlabeled standards (with Parlar congener #) continues to grow, so visit CIL's website and watch for future product announcements for more details. The new POPs toxaphene mixtures are ideal for researchers interested in primary investigations of the most prevalent congeners.

Triazine Herbicide and Metabolite Standards

Atrazine is one of the most widely used herbicides in the world. In recent years, studies on the correlation of physical and reproductive disorders in frogs with atrazine exposure has been a controversial topic. With CIL's comprehensive collection of carefully purified and prepared standards of atrazine and its many metabolites, researchers should have some powerful tools to refine their investigations.

Pesticide Standard Mixtures

New applications and increased testing by IDMS have led to the development of several pesticides mixtures being offered for the first time in this catalog. Our expanded POPs pesticide calibration series and related spiking mixtures contain all pesticides listed as Stockholm Convention POPs, including kepone (aka chlordcone), HCHs (including lindane), pentachlorobenzene, and endosulfan I and II. These solutions allow analysts to use preformulated mixtures for detection and quantification of the complete series of these important POPs.

Chemical Weapon Metabolite Standards

Often quite similar to metabolites of common pesticides, chemical weapons metabolite standards help researchers determine potential contamination from dangerous compounds, such as nerve agents and other toxic chemicals. Several metabolites, degradation byproducts, and others are represented in this section.

Chlorinated Cyclodiene Pesticide Standards

Catalog No.	Compound	Formula	Concentration	Amount
CLM-4725-1.2	Aldrin ($^{13}\text{C}_{12}$, 99%)	* $\text{C}_{12}\text{H}_8\text{Cl}_6$	100 µg/mL in nonane	1.2 mL
